Course Description

First order differential equations, higher order differential equations, series solutions, the Laplace transformations, systems of first order linear equations, initial-value problems.
Prerequisites: Math 2414.

Student Learning Outcomes: Upon successful completion of this course a student will be able to:

1. Classify differential equations into partial differential equations and ordinary differential equations, linear or nonlinear, homogeneous or non-homogenous, first order, second order or higher order differential equations.
2. Explain a general solution and a particular solution, an initial-value problem, the Existence and Uniqueness Theorem; Wronskian Determinants and fundamental 3 set of solutions; Explain Growth-Decay Model and Predator-and-Prey Model that use differential equations to model real world problems.
3. Use methods such as Separating Variables, Variation of parameters, Finding a Potential Function, Substitution and Euler's Method to solve 1st order differential equations for explicit solutions and approximation solutions.
4. Explain the solution structure of higher order linear differential equations and solve some higher order linear differential equations with constant coefficients, some second order linear differential equations with general coefficients, and some system of first order linear differential equations.
