COURSE DESCRIPTION

This course is designed for advanced students with a thorough background in biology and cell biology. Therefore, this course provides students with a greater understanding of molecular, developmental, and network mechanisms of neuronal function. Emphasis will be placed on molecular and cellular components of neurons and other nervous system cell types at their most basic level. In addition, unique specific systems, particularly sensory and movement systems as well as the topics of brain mechanisms of emotions, mental illness, brain wiring, learning and memory will be explored. Students are expected to gain an in-depth understanding of basic principles and concepts of neurons at the molecular levels, learn to reason scientifically, and to understand and describe the cooperative function of organelles in specialized neuronal cells.

The syllabus/schedule are subject to change.

STUDENT LEARNING OUTCOMES

1. Describe unique and common characteristics of unifying concepts of neurons (foundations) including:
 - Cellular components of neurons
 - Functional Role of Glia
 - Membrane Potential, Action Potentials and Neurotransmitters
 - Receptors and Postsynaptic Integration
2. Understand sensory motor systems, particularly:
 - Chemical Senses
 - The Eye
 - The Somatic Motor System
3. Apply principles of neuroscience to demonstrate an understanding of the brain and behavior, particularly:
 - Sex and the Brain
 - Brain Mechanisms of Emotion
 - Mental Illness
4. Describe the concepts of complex neural processes (the changing brain) including:
 - Wiring the Brain
 - Molecular Mechanisms of Learning and Memory
5. Think **experimentally and critically** about the concepts described above
