

# Publishing Content

Cascade is not the web server. You can create, edit, save and preview assets in Cascade but they are *not visible on the web until they are published*.

**Publishing** sends items to the web server and makes them available to everyone on the internet.

## Direct Publishing

Most Cascade users can publish any of their assets by selecting the Publish tab then clicking Submit. Your publish job then goes into the queue behind any other publish jobs. Once your job is in the queue, you are free to continue working. Any changes made after submitting to the publish queue will not be published unless you submit for publishing again.

The publishing action is available for:

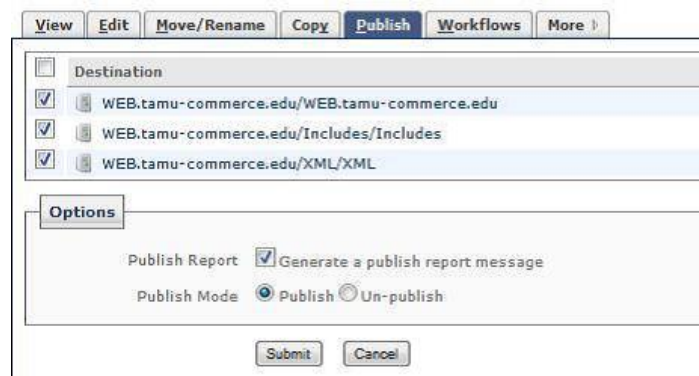

- Pages
- Files
- Folders
- Sites
- Targets
- Destinations
- Publish Sets

To publish one of these asset types:

1. Navigate to the asset
2. Select the **Publish** tab

3. For Pages only: Select the checkboxes for the Page's configurations that you'd like to publish.
4. Select the checkboxes corresponding to the Destinations you'd like to publish to.

5. Select Submit to publish your content to the selected destinations.
6. CMS will respond with the following message if your page publish successfully
